

Ecoregions of Indiana and Ohio

Ecoregions denote areas of general similarity in ecosystems and in the type, quality, and quantity of environmental resources; they are designed to serve as a spatial framework for the research, assessment, management, and monitoring of ecosystems and resources components. Ecoregions are directly applicable to the immediate needs of state agencies including the development of biological criteria and water quality standards as well as the establishment of management plans for nonpoint-source pollution. They are also relevant to integrated systems management, an ultimate goal of most federal and state resource management agencies.

The approach used to compile this map is based on the premise that ecological regions can be identified through the analysis of the patterns and the composition of biotic and abiotic phenomena that affect or reflect differences in ecosystem quality and integrity (Olson 1986, Olson 1987, 1995). These phenomena include geology, physiography, vegetation, climate, soils, land use, wildlife, and hydrology. The relative importance of each characteristic varies from one ecological region to another regardless of the hierarchical level. A Biome-level hierarchical scheme has been adopted for different levels of ecological regions, with level II dividing the continent into 52 ecoregions. At level III, the continental United States contains 90 ecoregions (United States Environmental Protection Agency [USEPA], 1997). Level IV is a further subdivision of level III ecoregions. Explorations of the methods used to define the USEPA's ecoregions are given in Olson (1995), Griffith and others (1994), and Galvan and others (1995).

This level III and IV ecoregion map was compiled at a scale of 1:250,000. It depicts revisions and subdivisions of earlier level III ecoregions that were originally compiled at a smaller scale (USEPA 1997, Olson 1987). The project is part of a collaborative project primarily between the USEPA, Region V, the USEPA's National Health and Environmental Effects Research Laboratory, Corvallis, Oregon, the Indiana Department of Environmental Management (IDEM), the Ohio Department of Natural Resources (ODNR), the Ohio Environmental Protection Agency (Ohio EPA), the United States Department of Agriculture - Forest Service (USFS), the United States Department of Agriculture - Natural Resources Service (USFS) (formerly the Soil Conservation Service), and the United States Department of the Interior - U.S. Geological Survey (USGS) - Earth Resources Observation Systems (EROS) Data Center.

This project is associated with an interagency effort to develop a common framework of ecological regions. Reaching that objective requires recognition of the differences in the conceptual approaches and mapping methodologies that have been used to develop the most commonly used existing ecoregion maps. Frameworks, including those developed by the USFS (Olson and others, 1990), the USEPA (Olson 1987, 1995), and the NRCS (U.S. Department of Agriculture - Natural Resources Service, 1992). As each of these frameworks is further developed, the differences between them become. Regional collaborative projects such as this one in Indiana and Ohio, where agreement can be reached among multiple resource management agencies, is a step in the direction of attaining consistency and consistency in ecoregion frameworks for the entire nation.

Olson, J.R., 1986. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 76, no. 1, p. 108-132, scale 1:750,000.

Olson, J.R., 1987. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 77, no. 1, p. 108-132, scale 1:750,000.

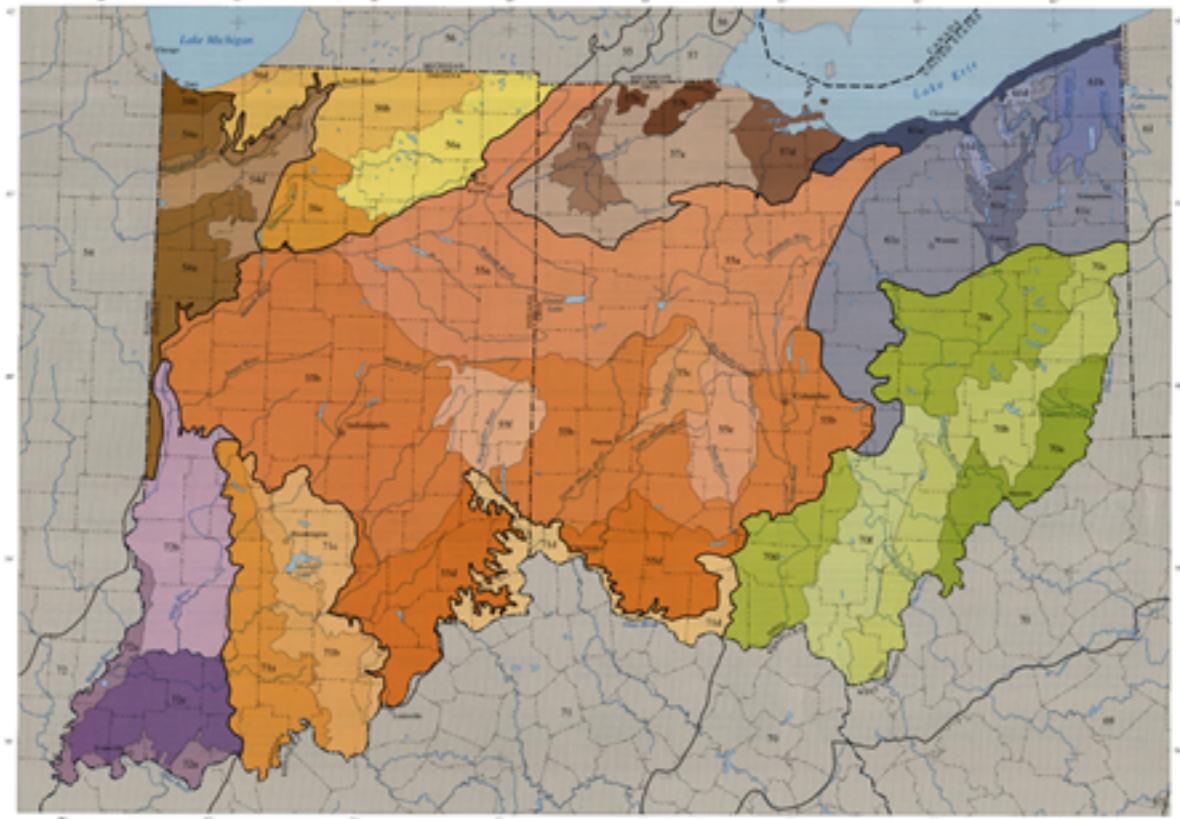

Olson, J.R., 1995. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 85, no. 1, p. 108-132, scale 1:750,000.

USEPA, 1997. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 87, no. 1, p. 108-132, scale 1:750,000.

USFS, 1992. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 82, no. 1, p. 108-132, scale 1:750,000.

USGS, 1997. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 87, no. 1, p. 108-132, scale 1:750,000.

USGS, 1998. Ecoregions of the continental United States (map). *Annals of the Association of American Geographers*, v. 88, no. 1, p. 108-132, scale 1:750,000.

PRINCIPAL AUTHORS: Alan E. Woods (Indiana Department of Environmental Management), James M. Olson (USEPA), Scott R. Swenson (ODNR), Division of Geological Survey, Timothy B. Carter (ODNR - Division of Soil and Water Conservation), William B. Swenson (NRCS), and Sandra R. Auerbach (EROS Corporation).

COLLABORATORS AND CONTRIBUTORS: Thomas P. Simon (USEPA), Chris D. Yoder (Ohio EPA), Patrick Muehler (USEPA), Thomas R. Loveland (USGS), C. Lee Bridges (ODNR - Office of Water - Biological Studies Section), Gary L. Swenson (NRCS), Kelly Caputo (Ohio EPA), Susan A. Swenson (ODNR - Office of Water - Biological Studies Section), Tom Nantz (National Park Service - Cuyahoga National Recreation Area), James B. Gieseman (Professor Emeritus of Zoology, DePaul University), Barbara K. Anderson (Professor of Biology, Cuyahoga Community College), and John Harrison (Professor, Department of Geography, Kansas State University).

This project was partially supported by funds from the USEPA - Office of Research and Development - Regional Applied Research Office (RADO) program.

54. Central Corn Belt Plains

The Midwest Corn Belt ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

55. Eastern Corn Belt Plains

The Eastern Corn Belt ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

56. Southern Michigan/Northern Indiana Drift Plains

The Southern Michigan/Northern Indiana Drift Plains ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

57. Huron/Erie Lake Plains

The Huron/Erie Lake Plains ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

58. Erie/Ontario Drift and Lake Plain

The Erie/Ontario Drift and Lake Plain ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

59. Western Allegheny Plateau

The Western Allegheny Plateau ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

60. Interior Plateau

The Interior Plateau ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

61. Interior River Lowland

The Interior River Lowland ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

62. Interior River Lowland

The Interior River Lowland ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

63. Karikarua Marsh

The Karikarua Marsh ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

64. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

65. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

66. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

67. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

68. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

69. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

70. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.

71. Karikarua Sand Area

The Karikarua Sand Area ecoregion is characterized by rich, very fertile soils. Today, corn, soybeans, and wheat are the principal crops and are heavily planted. Corn and soybeans are planted in rows, and wheat is planted in rows. Corn and soybeans are planted in rows, and wheat is planted in rows.
